The total time spent in A&E is reflected here by two measurements. First, the graph displays the percentage of people treated within four hours of arrival at A&E. For the month of July we are performing well with 96.5% of patients being treated within 4hrs. This is an improvement from last month. Overall the trend is positive with our department outperforming the target every month.

The second measurement is the total time spent in A&E as recorded by the 95th percentile, this can be found in the summary box below. This should also be under 4hrs, and as such we can say that our department is successfully meeting both measurements for the total time spent in A&E target.

The hospital has consistently met the national 95% target for 4 hour waits in the Accident and Emergency since the target was introduced. February showed performance within target with 96.3% of patients being seen and treated within 4 hours of arrival in the department. This is despite having a few days which meant performance wasn’t met, however the department recovered sufficiently to meet the target for the month.
